

Database Fundamentals & Design

Presented by:

Abdelrahman Eid

Structured Query Language (SQL)

- A standard language used to create, maintain and control database.
- It's divided into:
 - Data Definition Language (DDL).
 - Data Manipulation Language (DML).
 - Data Control Language (DCL).

Database Constraints

- Not Null.
- Primary Key.
- Unique Key.
- Referential Integrity (FK).
- Default value

Data Definition Language

- Create.
- Drop.
- Alter.

Create Command

✓ Create table "table_name"

("column name" data type, "column name" data type, ...)

Example (1)

```
CREATE TABLE customer  
(ID int Not Null, First_Name char(50), Last_Name char(50),  
City char(25), Birth_Date date, personID char(50), Primary key (ID)  
FOREIGN KEY (PersonID) REFERENCES Persons(PersonID));
```

Example (2)

```
CREATE TABLE customer  
(ID int Primary key, First_Name char(50), Last_Name  
char(50), City char(25), Birth_Date date);
```

Data Types

A data type determines the type of data that can be stored in a database column. The most commonly used data types are:

1. Alphanumeric: data types used to store characters, numbers, special characters, or nearly any combination.
2. Numeric
3. Date and Time

Executing Queries

Executing queries occurs when in a query session by:

- Selecting the Execute Icon
- Pressing the F5 key

Note:

- Select the Database Before Executing Query or write
- Use Keyword + DB Name on top of the Query

Drop Command

- ✓ Drop table "table name"
- ✓ Drop table Customer

Alter Command

- ✓ `ALTER TABLE table_name ADD column_name datatype`
- ✓ `ALTER TABLE table_name DROP COLUMN column_name`

Example:

- ✓ `ALTER TABLE Customer ADD Address char(40)`
- ✓ `ALTER TABLE Customer DROP COLUMN Address`

Data Manipulation Language

- Insert.
- Update.
- Delete.
- Select.

INSERT Command

Person table

LastName	FirstName	Address	City
El-Sayed	Mohamed	Nasr City	Cairo

✓ **INSERT INTO** "table_name" **VALUES** ('value1', 'value2', ...)

- **Insert a New Row:**

INSERT INTO Person **VALUES** ('Saleh', 'Ahmed', 'Moharam bak', 'Alex.')

Person table

LastName	FirstName	Address	City
El-Sayed	Mohamed	Nasr City	Cairo
Saleh	Ahmed	Moharam bak.	Alex.

INSERT Command (Cont.)

- Insert Data in Specified Columns:

Person table

LastName	FirstName	Address	City
El-Sayed	Mohamed	Nasr City	Cairo

- Insert a New Row:

INSERT INTO Person (LastName, City) **VALUES** ('Hassan', 'Assuit')

Person table

LastName	FirstName	Address	City
El-Sayed	Mohamed	Nasr City	Cairo
Hassan			Assuit.

Update Command

✓ **UPDATE** "table_name"
SET "column_1" = {new value}
[**WHERE** {condition}]

Example (1)

UPDATE Person
SET City= 'Assiut'

All records will be updated

Example (2)

UPDATE Person
SET City= 'Assiut'
Where FirstName = 'Ahmed'

Only records with first name 'Ahmed' will be updated

Update Command (Cont.)

- ✓ Update several Columns in a Row:

LastName	FirstName	Address	City
El-Sayed	Mohamed	Nasr City	Cairo
Saleh	Ahmed	Moharam bak.	Alex.

```
UPDATE Person
SET     Address = '241 El-haram ', City = 'Giza'
WHERE  LastName = 'El-Sayed'
```

LastName	FirstName	Address	City
El-Sayed	Mohamed	241 El-haram	Giza
Saleh	Ahmed	Moharam bak.	Alex.

Delete Command

✓ **DELETE FROM** "table_name"
[**WHERE** {condition}]

Example (1)

DELETE FROM Person

All records will be deleted

Example (2)

DELETE FROM Person
Where FirstName = 'Ahmed'

Only records with first name 'Ahmed' will be deleted

Simple Queries

Select <attribute list >
From < table list>
[Where <condition>]

- ✓ **select** *
from department;
- ✓ **select** emp_id, emp_name, dept_id
from employee;
- ✓ **select distinct** dept_id
from employee;

Simple Queries (Cont.)

```
Select dept_id, dept_name  
from   department  
where  location = 'Cairo';
```

Comparison Conditions

- = Equal.
- > greater than.
- >= greater than or equal.
- < less than.
- <= less than or equal.
- <> not equal.

```
Select last_name, salary  
from employee  
where salary >1000
```

Logical Conditions

- AND.

```
Select last_name, salary
from employee
where city = 'Assiut' and salary > 1000;
```

- OR.

```
Select last_name, salary
from employee
where city = 'Assiut' OR salary > 1000;
```

- NOT.

```
Select emp_id, last_name, salary, manager_id
From employee
where manager_id NOT IN (100, 101, 200);
```

Other Comparison Conditions

- **Between** **AND** (between two values - **Inclusive**).

```
Select last_name, salary
from employee
where salary between 1000 and 3000;
```

- **IN** (set) (Match any of a list of values)

```
Select emp_id, last_name, salary, manager_id
From employee
where manager_id IN (100, 101, 200);
```

- **Like** (Match a character Pattern)

```
Select first_name
from employee
where first_name Like 's%';
```

Arithmetic Expressions

```
Select last_name, salary, salary + 300 as 'new salary'  
from employee;
```

- Order of precedence: $*$, $/$, $+$, $-$
- You can enforce priority by adding parentheses.

```
Select last_name, salary, 10 * (salary + 300)  
from employee;
```

Order by Clause

- It is used to sort results either in **ascending** or **descending** order.

✓ **Select** fname, dept_id, hire_date
 From employee
 Order by hire_date [**ASC**];

✓ **Select** fname, dept_id, hire_date
 From employee
 Order by hire_date **DESC**;

✓ **Select** fname, dept_id, salary
 From employee
 Order by dept_id, Salary **DESC**;

THANK YOU
